Fire Restoration and Mold Remediation

Removing char, soot and carbon buildup has always been an onerous task. Cryogenesis can greatly reduce time over conventional methods of scraping, sanding, wire brushing. Because the technology cleans what you can see, dry ice cleaning can access those hard to reach nooks and crannies that may not be easily reached with ordinary tools. Cryogenesis is also a totally dry process, so cleaning of smoke and fire damage from ceilings over factory equipment becomes easier with little or no covering and masking is required. Being non waste generating, there is only the contaminant left to dispose of, unlike soda, water or other blasting media.

Removing mold spores from wooden beams, ceilings, cinder block all becomes less tedious with Cryogenesis. Where it takes your competitors with a crew of 3 or 4 men days to clean basement walls, using Cryogenesis will take you mere hours. Our dry ice accelerators are totally portable and air driven – requiring no electricity for operation. This allows you to get to more places than other systems on the market today. Cryogenesis will also allow your operators to get into those hard to reach places, reducing there exposure in cramped and demanding areas.
